Circular economy

History, concepts and consequences

Hans Stegeman

Outline

- 1. Circular economy: (history of) the concept
- 2. Circular economy: three layers in the concept
 - Circular business models
 - Circular value chains
 - Circular economy
- 3. Macro economics of Circular Economy

Circular economy

(History of) the concept

From circular to linear

(history of) the concept

- Before the Industrial Revolution, cyclicality was the (natural) way of organizing society
- The origins of linearity can be traced back to the Enlightenment (Turgot, 1750): progress, as measured by an increase in material wellbeing, technological advance and better life conditions became the new normal
- Adam Smith (1776): Economic growth as the central tenet of neoclassical economics
- Central measure (since 1930s): Gross Domestic Product (Kuznets, 1934).
- GDP is the ultimate linear measure: measurement of value added of production
- Standard economics: Growth model (Solow,1957), endogenous growth (Romer, 1994)

Critics

(history of) the concept

- Critics on linear economy:
- Classical: Malthus (1798): 'perpetual struggle for room and food' linear environment and exponential growth population
- Starting from 60s: Boulding (1966) Club of Rome (1972), Daly (1977):
 - Main claim: Economy is not isolated from environment and the economy reaches limits
 - Industrial ecology
 - Environmental economics
- Critics on the concept GDP
- (among others): Coyle (2014), Fioramonti (2013)
 - Main claim: GDP is not the right way to describe economic development, let alone wellbeing
 - Alternative measures for welfare (Stegeman, 2016, 2017)
 - Amendments of GDP (OECD, 2014)

From linear to circular

(history of) the concept

Mainstream economy

Neoclassical (endogenous) growth theory

Ecological Economy (Czech & Daly 2004)

Circular economy (Pin and Hutao, 2007)

Economic system

Nature

Nature Economic system

Nature Economic system

Definitions

(history of) the concept

A circular economy has benefits that are operational as well as strategic. On both a micro and macroeconomic as strategic. A circular economy has benefits that are operational and the environment while as strategic, on both a micro and economic boosting job creation, economic growth, investment and as strategic, on both a micro and economic growth.

A circular Economy as a strategic, on both a micro and economic growth and economic growth, investment and as strategic, on both a micro and economic growth.

A circular Economy as a strategic, on both a macroeconomic growth.

A circular Economy as a strategic, on both and economic growth and economic growth.

A circular economic growth and economic growth and economic growth and economic growth.

A circular economy as a strategic, on both a macroeconomic growth.

A circular economy as a strategic, on both a macroeconomic growth.

A circular economy as a strategic, on both a macroeconomic growth.

A circular economy as a strategic, on both a macroeconomic growth.

A circular economy as a strategic, on both a macroeconomic growth.

A circular economy as a strategic, on both a macroeconomic growth.

A circular economy as a strategic growth and economic growth and economic growth. A circular economy has benefits that a geometric boosting job creation, economy has benefits that a geometric boosting job creation, economy has benefits that a geometric potential boosting job creation, economy has benefits that a geometric potential boosting job creation, economy has benefits that a geometric potential boosting job creation, economy has benefits that a geometric potential boosting job creation, economy has benefits that a geometric potential boosting job creation, economy has benefits that a geometric potential boosting job creation, economy has benefits that a geometric potential boosting job creation, economy has benefits that a geometric potential boosting job creation, economy has benefits that a geometric potential boosting job creation, economy has benefits that a geometric potential boosting job creation, economy has benefits that a geometric potential boosting job creation, economy has benefits that a geometric potential boosting job creation, economic growth.

Circular economy has benefits that a geometric potential boosting job creation, economic growth.

A circular economy has benefits that a geometric potential boosting job creation, economic growth.

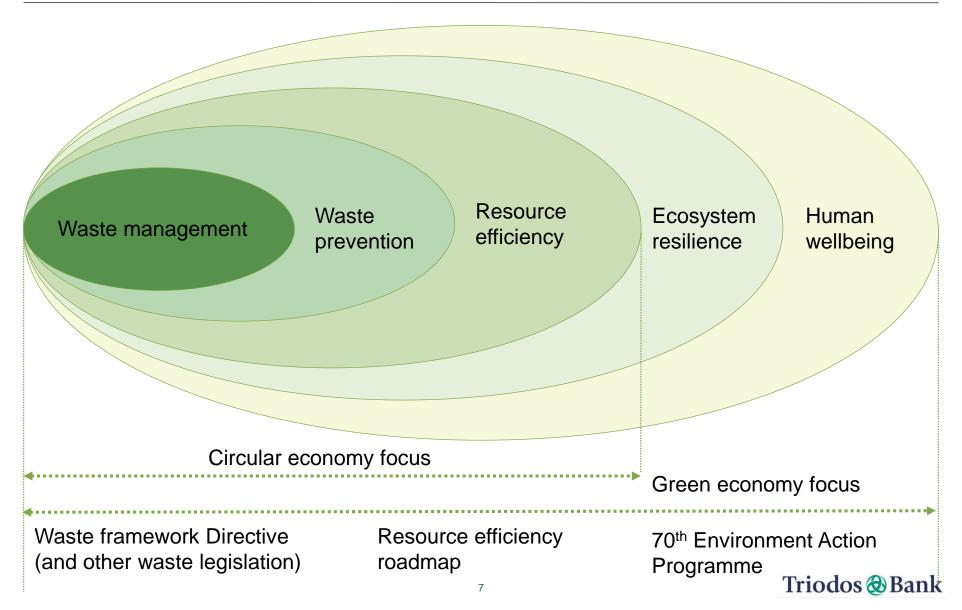

A circular economy has benefits that a geometric potential boosting job creation, economic growth.

A circular economy has benefits that a geometric potential boosting job creation, economic growth.

A circular economy has benefits that a geometric potential boosting job creation, economic growth. is a trillion-dollar opportunity, with nuge potentia. (Le innovation, job creation and economic growth.) and environmental protection' (Lieder et al 2016). -411 be achieved through s, and narrowing 'An economy based on a spiral-loop system that minimizes ce, repair, reuse, matter, energy-flow and environmental deterioration without nd recycling" restricting economic growth or technological progress'. (Stahel, 1982)

Circular economy, green economy and policy

(history of) the concept

Theoretical background: a masterblend

(history of) the concept

Performance economics Stahel (1984)

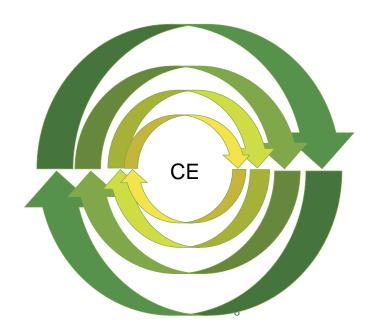

Ecological economics (Daly, 1977; Jackson, 2015)

Environmental economics Pearce and Turner (1989) Blue economy (Pauli, 2014)

Industrial ecology (Erkman, 1997; Ayres, 1989)

Biomimicry (Benyus, 2002)

Cradle to cradle (Braungart and McDonough, 2003)

Definitions

(history of) the concept

- Definition we use: The CE is based on the idea of a (re-)design of production systems at various levels with a central focus on value preservation in closed loops throughout the lifespan of (raw) materials and goods (Jonker et al. 2017)
- This means: analyzing CE at three levels:
 - Individual organizations: Circular Business Models
 - Industries: circular Value Chains
 - Society: a circular macro economy

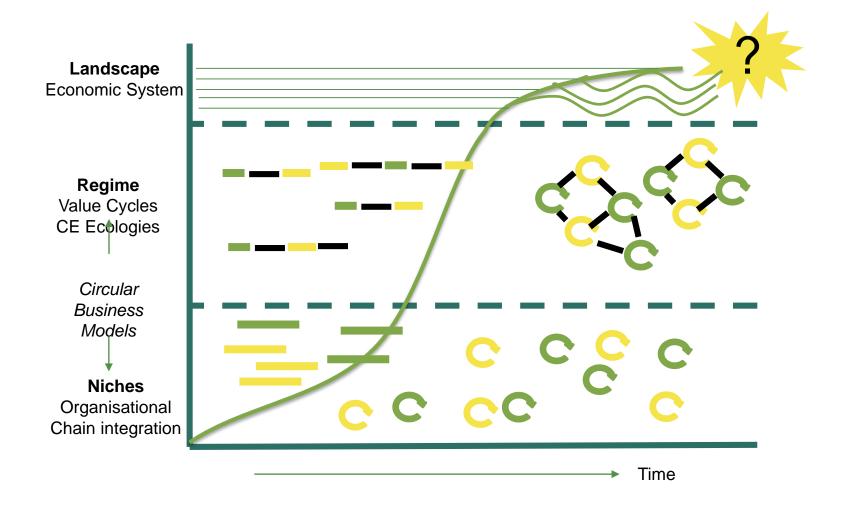

Circular economy

Three layers of CE

From micro to macro

Three layers of CE

Business models: What differentiates CBMs?

Three layers of CE: CBM

Financial value

Ecological and/or social value

Charity

New Business Models:

- Circular Business models
- Social enterprises
- Community-based business models

Convential business models

Only donations/ subsidies

Community ownership and investment in business

Largest part revenues from market transactions Non-profit Largest part revenues from market transactions Profit re-invested or to investors Largest part of revenues from market Sustainability in core business

Largest part of revenues from market Financially driven

Solely societal impact

Multiple value creation: Triple Bottom Line

Financial impact first

Building Blocks of Circular Business Models

Three layers of CE: CBM

Loops

Value creation

Strategy

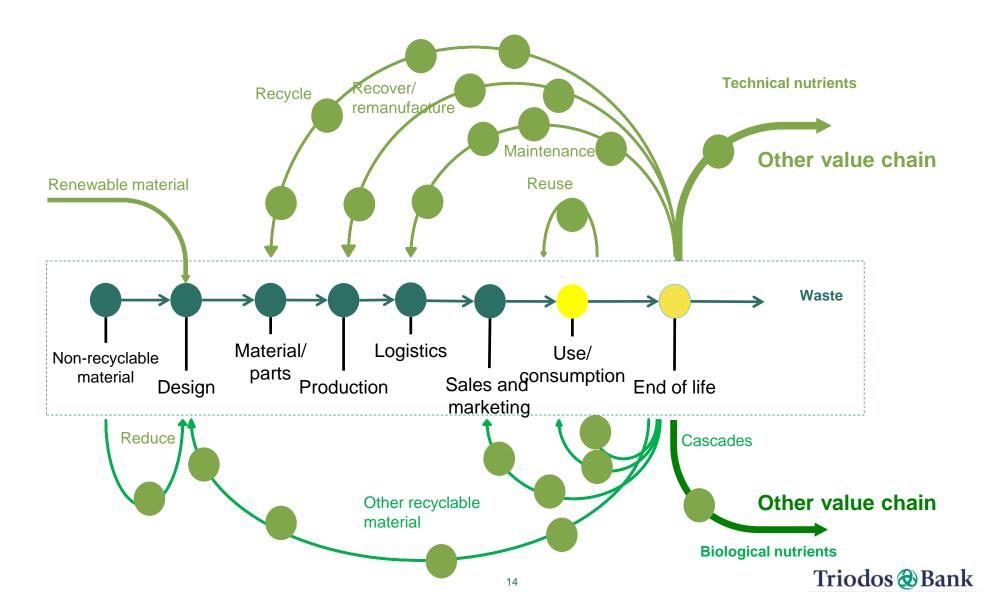

Organisation

Earnings model

Building Blocks (1): Loops

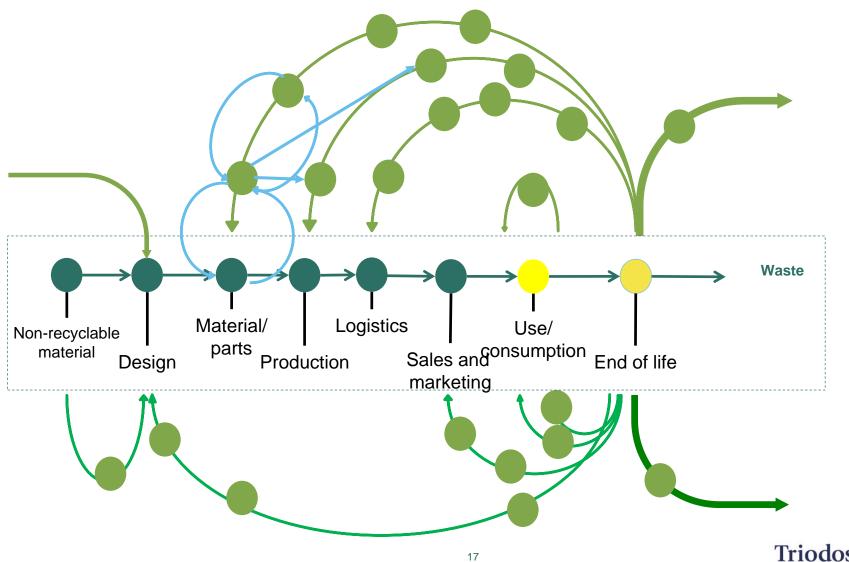

Building Blocks (2): Value creation

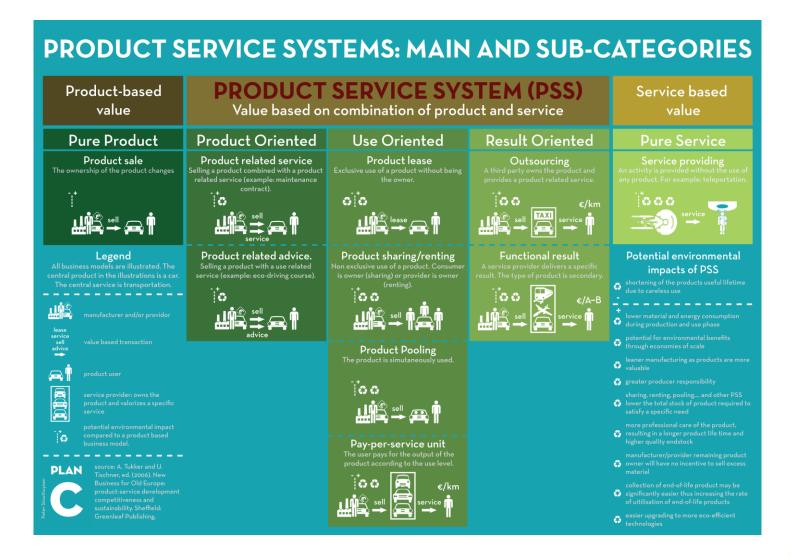

Building Blocks (3): Strategy

Building Blocks (4): Organization

Building Blocks (5): Earnings model

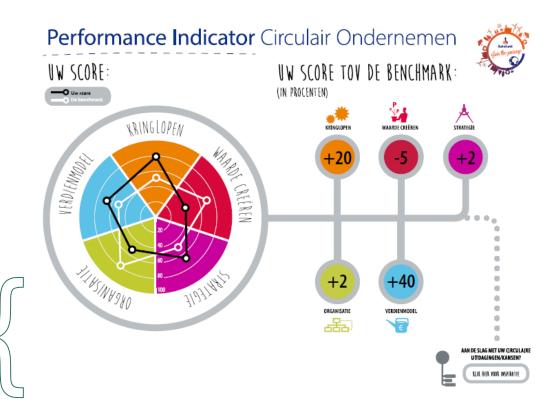

Measuring building blocks

Three layers of CE: CBM

Trying to discover CBMs in the Netherlands in large-scale survey

Preliminary results:

- Circular in linear environment
- Collaboration in value chain is only possible if there is alignment in objectives, intentions and trust
- Important barriers: clients, government and finance

Macro economics of circular economy

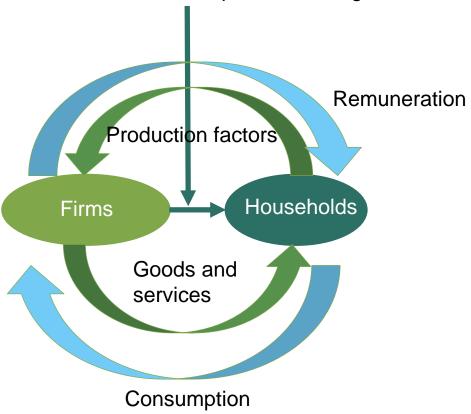

The third layer of CE

Going from linear to circular (1): linear macro 101

Macro economics of CE

Economic growth: value added of market production of goods and services

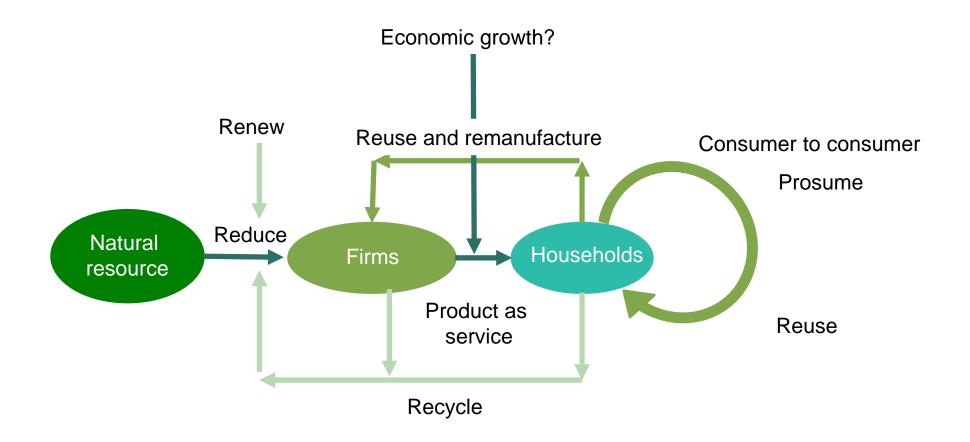

Going from linear to circular (2): Why a circular macro economy? Macroeconomics of CE

- Ecological perspective: resource scarcity/sustainability (limits of earth's capacity)
- Technological perspective: innovation enables new business models (IoT, AI, 3D-printing, platform models)
- Social perspective: an affluent society needs has the luxury of creating more value by using less, and (sometimes) producing local
- Economic perspective: efficient global value chains and more efficient usage of all goods produced
- Circular economy at macro level a means to reach goals such as sustainable development (Brundtland, 1987)

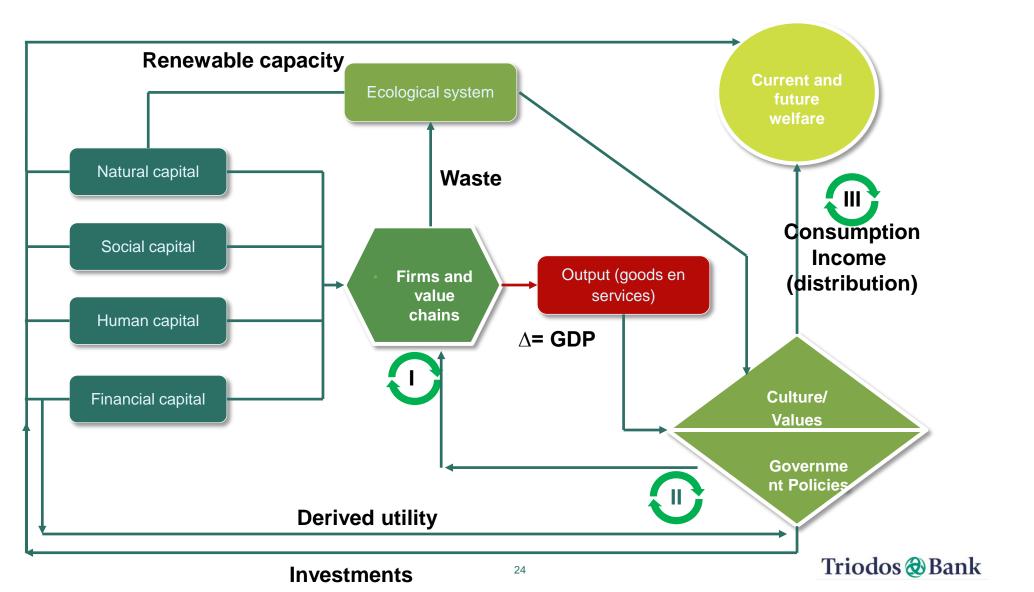

Going from linear to circular (3): circular macro

Macroeconomics of CE

Going from linear to circular (3): circular macro elaborated

Macroeconomics of CE

Going from linear to circular (3): a few dilemmas

Macroeconomics of CE

- Will practices of CE lead to sustainable development?
 - o Rebound effects?
 - Substitution effects?
- Who will be the losers of CE and what to do with them?
- O What is the transition path?
 - o Role of government policies
 - Role of consumers

"Economy is not baseball, where the game is always played by the same rules."

Nate Silver, The Signal and the Noise:
Why So Many Predictions Fail - But Some
Don't
